GoodScore-Case Study

GoodScore: Turning a Credit Score Check into a Credit Plan

Product case study by Sudiksha Gupta · Independent concept work

> **In one line:** Most users open GoodScore to check a low score and leave. A personal 90-day plan, built around the two actions that move their score most, turns a one-time check into a habit.

---

1. Context

- GoodScore is a Bengaluru fintech, founded in 2023, that helps people monitor and improve their credit health. It combines credit bureau data, bank transactions and spending into one view.
- It offers score monitoring, payment management, improvement guidance, dispute support and a credit marketplace that connects users with lenders such as HDFC Bank, KreditBee and Tata Capital.
- It raised a $13 million Series A led by Peak XV (reported October 2025) and plans to grow in tier 2 and tier 3 cities.

Why engagement matters to the business: the marketplace earns when users become credit-ready and borrow. A user who checks once and leaves never reaches that point.

---

2. Problem

Example user: Riya, 26, salaried, Lucknow

Trigger	Her credit card application was rejected
What she sees	A score of 642 marked "Poor", plus a long list of factors

What she feels	Judged, confused about what to do first
What she does	Closes the app and doesn't come back

The score is accurate, but it reads like a verdict. Riya can see the problem, not the path out of it.

---

3. Insights

- **People arrive after a rejection.** Their intent is "fix this", not "monitor this". The product answers the wrong question.
- **Too many factors, no order.** Payment history, utilisation, enquiries and credit age all appear at once with equal weight.
- **Improvement is slow and invisible.** Bureau scores update roughly monthly, so effort feels unrewarded in week one.
- **Small actions often matter most.** Clearing one overdue payment or reducing card usage below 30% can move a score far more than anything else on the list.

To validate: funnel from first score view to second visit, exit points on the score screen, and user interviews with people who checked once.

---

4. Hypothesis

If GoodScore shows each user the two actions most likely to raise their score, with an expected impact range and a 90-day plan, more users will complete an action, return to the app and become eligible for better credit offers.

---

5. Competitive landscape

	GoodScore today	Typical score apps and bank apps
Free score check	Yes	Yes
Factor breakdown	Yes	Yes
Ranked, personal action plan	Opportunity	Rare

	GoodScore today	Typical score apps and bank apps
Progress tracking toward a goal	Opportunity	Rare

Takeaway: checking a score is a commodity. Owning the "how do I fix it" moment is the differentiator.

6. Solution

Priority	Feature	What it does
High	Top two actions	Ranks factors by likely impact and shows only the two that matter most
High	Impact range	"Clear this ₹4,200 overdue: likely +20 to 40 points", shown as a range, never a promise
High	90-day score plan	Breaks the actions into weekly steps with reminders
Medium	Progress tracker	Shows completed steps and score movement after each bureau update
Medium	Credit-ready moment	When the score crosses a lender's threshold, show matching offers

User flow

1. Score screen leads with "Your fastest way to a better score" instead of the factor list.
2. User sees two actions with impact ranges and taps "Start my plan".
3. A 90-day plan appears with this week's step.
4. Weekly nudges by app and WhatsApp keep the plan moving.
5. After each bureau update, the app shows what changed and why.
6. Once credit-ready, the user sees offers they now qualify for.

7. Success metrics

Metric	Target
Users completing one score action within 30 days	Primary metric

Metric	Target
60-day return rate after first score check	Increase
Plan start rate from the score screen	30%+
Marketplace applications from plan users	Increase
Complaints about misleading projections	Guardrail: near zero

8. Risks and trade-offs

Risk	Mitigation
Projections seen as promises	Always show ranges with a plain caveat
Pushing loans to users still improving	Show offers only after a user crosses a credit-ready threshold
Nudge fatigue	Weekly cadence, easy to pause
Bureau update delays	Show completed actions immediately, score change later

9. Rollout

1. **Test:** show the top-two-actions card to 10% of users who score below 700.
2. **Measure:** action completion and 30-day return rate against a control group.
3. **Expand:** add the full 90-day plan and progress tracker, then the credit-ready offers.

10. Conclusion

GoodScore already tells users where they stand. The bigger opportunity is telling them what to do next. A short, ranked plan turns a disappointing number into a starting point, keeps users coming back, and grows the pool of credit-ready borrowers the marketplace depends on.
